

PASSWORD MIGRATION CHECKLIST

BEFORE YOU START

- ☐ Pick a password manager. I recommend Proton Pass, but Bitwarden, 1Password, or iCloud Keychain are all fine.
- ☐ Block 60–90 minutes of focused time. Have both your computer and phone handy.
- ☐ List your top ten critical accounts (email, bank, cloud storage, social, phone carrier, domain registrar, Apple/Google, password manager). Start there first!

INSTALL & SECURE THE MANAGER

- ☐ Install desktop app, browser extension, and mobile app.
- ☐ Create your account and set a long master passphrase (minimum 20 character consisting of letters, numbers, and special characters).
- ☐ Turn on MFA for the manager itself (TOTP or hardware key). Enroll at least two factors.

IMPORT EXISTING PASSWORDS

- ☐ Export passwords from old browsers/managers as CSV and import into the new manager.
- ☐ Run the health check to find weak/reused/breached passwords.

CLEAN UP & STRENGTHEN

- ☐ Merge duplicates and remove stale logins.
- ☐ Rotate any reused password using the generator.

ENABLE MFA ON THE TOP TEN

- ☐ Open each account's security page and enable TOTP or hardware keys (avoid SMS when possible).
- ☐ Store backup codes in the item's secure notes.

BUILD A RECOVERY KIT

- ☐ Store your master password somewhere safe and secure. I keep mine in Apple Notes and lock it.
- ☐ Add a second MFA method (spare device or second hardware key) and store it separately.
- ☐ Document emergency contact instructions if desired.

VALIDATE YOUR WORK

- ☐ Sign out of the manager on desktop, then sign back in with MFA.
- ☐ On your phone, autofill three different sites successfully.
- ☐ For one critical account, sign out everywhere and sign back in with MFA.

COMMON PITFALLS

- ☐ Browser keeps saving new passwords: turn off the browser's built-in password saving and suggestions.
- ☐ Only one hardware key enrolled: add two keys and label them.
- ☐ Backup codes misplaced: store codes in the corresponding item's secure notes.
